

Egyptian font metrics

01 / Basic signs and joins

Same Unicode input in every column. Each font supplies its own outline bounds. The pale frames show the resulting layout box, with 0.04 em padding.

Structure	Noto Sans EgyptHiero	NewGardiner	Segoe UI Historic
Single / seated man A1			
Single / bird G17			
Single / water N35			
Plain sequence A1 B1 G17			
Horizontal / tall + wide A1 H N35			
Vertical / tall + wide A1 V N35			

Reading the comparison

H = horizontal joiner (U+13431); V = vertical joiner (U+13430). Parentheses on page 2 describe the tree; segments use U+13437 / U+13438 where needed. Latin text retains the document font; only the signs use the selected file.

Egyptian font metrics

02 / Nested H/V relationships

Check left-to-right and top-to-bottom order, centered children, visible gaps, and containment within each frame. All columns use the same layout code.

Structure	Noto Sans EgyptHiero	NewGardiner	Segoe UI Historic
Horizontal then vertical (A1 H B1) V G17			
Vertical inside horizontal A1 H (B1 V G17)			
Two vertical columns (A1 V N35) H (G17 V B1)			
Three vertical levels N35 V G17 V A1			
Wide signs over tall sign (N35 H B1) V A1			
Deeper nesting A1 H (B1 V (G17 H N35))			

Scope of this comparison

Historical 0.4 corpus, rebuilt with XSR 0.9. The native parser supplies structure; fontTools measures the selected font; XSR packs the ink boxes; XeTeX renders that same font file. Natural proportions are retained and groups shrink to at most 1 em in height. This is generic geometric packing, without font-specific optical corrections. Insertion, overlays, enclosures, rotation and damage appear in the main Egyptian showcase.
